

SmaSEQ

AUTOMATION SOFTWARE

SmaSEQ (Simple Modular Automation Sequencer) is a revolutionary product which integrates the common applications in the field of automation and further modularize them. These include Visual Inspection, Robot Manipulator, Motion Control, IO Control, Device Communication, etc.

It is an automation software that combines vast professions into one. As opposed to the traditional production line where the user has to individually operate each equipment via the corresponding software, SmaSEQ allows the user to simply connect the automation equipment to the platform, and the complete flow of the production line can be created via one simple software platform. This intuitive approach significantly reduces the threshold of automation.

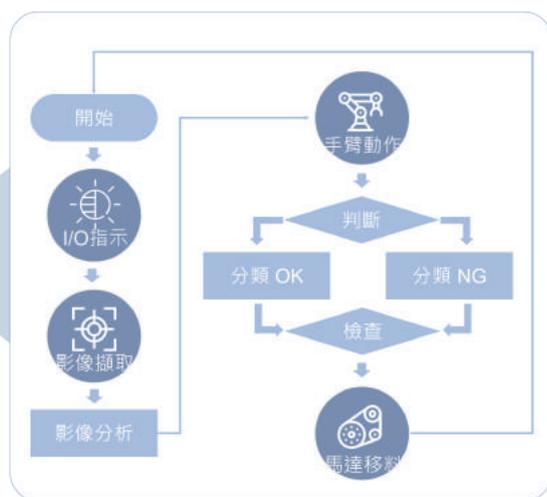

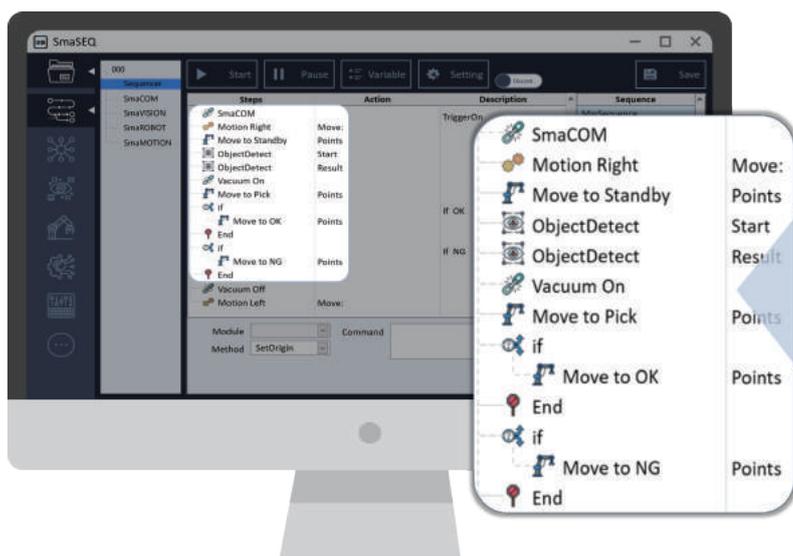

Intelligent Automation, Inspection and Testing. We empower both People & Machine.

No Programming Required

Intuitive Arrangement of Flow Control

SmaSEQ possesses many advantages that are non-existent in traditional automation software. There is no complex programming language, yet with an easy hands-on operating interface and a user-friendly menu of automation models to choose from. The user can perform detailed adjustments based on each individual model, further create or manipulate the flow based on the production line requirements.

With the intuitive concept of flow charts, the user is no longer required to write complex programming codes, but simply click or drag on the desired actions to adjust the production flow. With the use of different model elements to create and operate the automation process, the user can add, move, delete, or adjust the process flow. Also, the memo can be further added onto the flow to improve the project maintenance, thus significantly improve the efficiency.
